protein genes, and AAB87342-AAB87413 represent the proteins they encode.
AAB87414-AAB8745 represent human secreted protein fragments. The genes
and their corresponding secreted proteins are useful for preventing,
treating or ameliorating medical conditions, e.g., by protein or gene
therapy. Pathological conditions can be diagnosed by determining the
amount of the new protein in a sample or by determining the presence of
mutations in the new genes. Specific uses are described for each of the
52 genes, based on the tissues in which they are most highly expressed,
and include developing products for the diagnosis or treatment of
proliferative disorders, cancer, tumours, focatal and developmental
abnormalities, haematopoietic disorders, diseases of the immune system,
ALDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation,
allergies, neurological disorders (e.g., Albrimer's diseases,
allergies, neurological disorders (e.g., Albrimer's diseases,
parkinsons's disease), cognitive disorders, schizophrenia, asthma,
skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis,
cardiovascular disorders, angiogenic disorders, kidney disorders,

gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; secreted protein; proliferative disorder; cancer; tumour; foetal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder; AIDS; autoimmune disease; rheumatiod arthritis; inflammation; allergy; neurological disorder; Alzheimer's disease; Parkinson's disease; cognitive disorder; schizophrenia; asthma; skin disorder; psoriasis; sepsis; diabetes; atherosclerosis; cardiovascular disorder; angiogenic disorder; kidney disorder; agastrointestinal disorder; pregnancy-related disorder; endocrine disorder; infection; wound healing; vulnerary; cell culture; chemotaxis; food additive;

Axy AxF91858-AAF91929 represent CDNAs corresponding to 52 human secreted protein genes, and AAB8741 represent the proteins they encode. AAB87414-AAB8745 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 52 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, foetal and developmental abnormalities, haematopoietic disorders, disease of the immune system, proliferative disorders (e.g., rheumatoid arthitis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, constituted disorders, endicaters (e.g., psorials), sepsis, diabetes, atherosolerosis, cardiovascular disorders, angiogenic disorders, kidney disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, for prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting collurure of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemoteasis, and can be used in alleadoos specific for a protein of the invention can be used in alleagoostic immunosostate assay (ELISA). The present sequence represents a human certed protein of the invention.
                                                                                                                                                                                                                                    Nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers -

The polynucleotide sequences given in AAC59966 to AAC60015 encode the human secreted proteins given in AAB3473 to AAB3482. AAB34823 to AAB34852 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in Examples of activities include: cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; and cardiant. The polynucleotides and polypeptides are useful for preventing, treating or ameliorating a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. The polypucleotides are also decrease storage capabilities rhe polynucleotides are useful for chromosome identification. They are also useful as probes for diagnosing a disorder related to the female reproductive system,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                   particularly breast and/or ovary cancer. They are also useful in the gene therapy of breast and ovarian cancer. Nucleic acids, protein, antibodies, agonists and antagonists from the present invention are useful in the diagnosis, treatment and prevention of cancer, immune disorders, cardiovascular disorders, wound healing, neurological diseases and infectious disease. AAC59957 to AAC59965 and AAB34772 represents sequence used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; secreted protein; proliferative disorder; cancer; tumour; foetal abnormality; haematopoietic disorder; immune system disorder; ALDS; autoimmune disease; rheumatoid arthritis; inflammation; allergy; neurological disorder; Alzheimer's disease.

                                                                                                              AAF AAF91858-AAF91929 represent cDNAs corresponding to 52 human secreted protein genes, and AAB87413 represent the proteins they encode. AAB87414-AAB8745 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 52 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, allergies, neurological disorders, diseases of the immune system, allergies, neurological disorders, schizophrenia, asthmä, allergies, neurological disorders, schizophrenia, asthmä, allergies, neurological disorders, schizophrenia, asthmä, allergies, neurological disorders, schizophrenia, asthmä, allergies, neurological disorders, schizophrenia, asthmä, allergies, neurological disorders, schizophrenia, asthmä, allergies, neurological disorders, schizophrenia, asthmä, allergies, programsy reganary-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell conture of primary tissues, to regenerate tissues, to identify their contained symptoms associated with the disorders mentioned above, and all adianostic immunosorbent assay (ELISA). The present sequence represents a human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GLREGRNALIAAGTGIVILGHVENIFHNFKGLLDGMTCNLRAKSFSIHFPLLKKYIEAIQ 149

human secreted proteins, and encode the proteins given in AAY01602 and human secreted proteins, and encode the proteins given in AAY01602 and AAY12030, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, haematopoiesis regulating activity, chemotactic/chemokinetic activity, haemostatic of thrombolytic activity, remotactic/chemokinetic activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding prometer sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                            Conjugate vaccine; Streptococcus infection; group B; polysaccharide; C protein alpha antigen; neonatal sepsis; meningitis; bca.
                                                                                                                                                                                                                                                                                                                                                   The sequence of the group B Streptococcus protein C (bca) was used in a search to find homologous proteins. A class of Gram-positive surface proteins with a common membrane anchor motif were found to be homologous. The amino acid compsn. at the C terminus of the protein is characteristic of a protein membrane anchor. See also AARS1996-4012.
                                                                                                                                                                                                                                                                                     New conjugate vaccine protects against group B Streptococcus infection - comprises gp. B Streptococcus polysaccharide conjugated to C protein alpha antigen deriv., useful against e.g. neonatal sepsis and meningitis

The vectors and methods are used to produce nectarins which may then be used for treating diseases or conditions related to deposition of exalate e.g. urolithiasis (kidney stones). This sequence represents the leader sequence of a barley germin protein which is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Interleukin-1 epsilon; IL-1; chromosome 2q; cytokine; antiinflammatory; immunosuppressant; antirheumatic; antiarthritic; antipsoriatic; ene mapping; immune system; treatment; inflammatory disease; autoimmune disease; rheumatoid arthritis; inflammatory bowel disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel method for expressing protein into

                                                                    The present protein sequence is that of mouse Interleukin-1 (IL-1) epsilon short splice variant. Mouse IL-1 epsilon DNA can be used as probe to identify human IL-1 epsilon by screening human genomic library. Human IL-1 epsilon gene is mapped to chromosome 2q and is mainly expressed in spleen, lymph node, thymus, tonsil and leucocyte tissues. IL-1 epsilon is a cytokine, with antilnflammatory, immunosuppressant, antirheumatic, antiarthritic and antipsoriatic activity. It can be used in the treatment of inflammatory or autoimmune diseases such as rheumatoid arthritis, inflammatory bowel disease and psoriasis. The DNA sequence can be used in chromosome identification, gene mapping and

must signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have anticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can be used in gene therapy. HSPPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of HSPP are used to treat or prevent disorders associated with increased civity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, reproductive or developmental disorders, (e.g. arteriosclerosis, carthma, Crohn's disease, Alzheimer's, Parkinson's congestive or ischaemic heart disease, Alzheimer's, Parkinson's congestive or ischaemic heart disease, Alzheimer's, Parkinson's congestive or ischaemic heart disease, Alzheimer's, Parkinson's congestive or ischaemic heart disease, Alzheimer's, Parkinson's or Huntington's diseases, schizophrenia, ovulatory defects, muscular dystrophy). HSPP nucleic acids can be used for the recombinant production of HSPP, for detecting HSPP in the recombinant production assays (for disease).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diagnosis and monitoring), in gene therapy, as antisense, triplex-forming or ribozyme therapeutics, for detecting related sequences or genetic variations, and for chromosomal mapping. HSPP are also used to raise specific antibodies (Ab) and to screen for agonists and antagonists (potential therapeutic agents). Ab are used to diagnose, or monitor, HSPP-related diseases (in usual immunoassays), as therapeutic antagonists in competitive drug screens, and for purification of HSPP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAX36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, and venerallymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.

invention. The proteins and corresponding coding sequences may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate bone marrow polypeptide expression. For example, to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of the polypeptides by expressing inactive proteins or to supplement the patient's own production of the polypeptides, by inserting the nucleic acids finto a host cell and culturing the cell to express the protein. The nucleic acid and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and therefore which patients may be in need of restorative therapy. The proteins may also be used as antigens in the production of antibodies against bone marrow proteins and in assays to identify madulators of their expression and activity. The anti-bone marrow protein antibodies and antagonists may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of the protein in samples as diagnostic agents for detecting the presence of the protein in samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (e.g. by enzyme linked immunosorbant assay (ELISA)). The proteins may be used to regulate haematopoiesis activity, and consequently in the treatment of myeloid or lymph cell disorders; in tissue regeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding bone marrow polypeptides, useful in diagnostic

AAZ4537 to AAZ4576 and AAZ44616 to AAZ55473 represent PCR primers used in the examplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Masignani V, Mora M;

AAC98773 to AAC99231 encode the human pancreatic cancer associated proteins, called pancreatic cancer antigens, given in AAB4008 to AAB54006. The human pancreatic cancer antigens have cytostatic, cancrective, nootropic, immunodulatory, relaxant, contraceptive, courroportective, nootropic, immunodulatory, relaxant, contraceptive, courroportective, nootropic, immunodulatory, relaxant, contraceptive, conventing, treating, or ameliorating and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer.

Agonists and antagonists to the antigens can be sceened for. The pancreatic cancer antigen polynucleotides can be used to design nucleic and hybridisation probes that can be used in chromosome mapping, linkage and diagnostic methods. The proteins can be used to design nucleic cand diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to generate antibodies which have used to pract for treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proteinteralive disorders. AAC992210 and AAB54467 represent sequences used in the exemplification of the present invention.
                    nootropic; immunomodulatory; relaxant; contraceptive; gynaecological;

                                                                                                                                                                                                                                                                                                                                                                                This sequence is an example of a histamine or serotonin binding compound (A), of the invention. The compounds are useful for regulating the action of histamine and serotonin (in e.g. inflammation and gastric acid secretion), the detection, quantification and removal of histamine or serotonin (in animals, plants, cell cultures, food materials, or humans) and in the treatment of various diseases and allergies.

(e.g. type I hypersensitivity reactions, urticaria, asthma, allergic rhinitis (hay fever), atopic dermatitis, insect bites and food and drug allergies, abnormal blood pressure, migraine, psychological disorders, respiratory disease, and coronary heart disease). Histamine may also be used to regulate cellular growth and tissue repair. The molecules may also be used as components of vaccines directed against blood-sucking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAX36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAX01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, saphingitis, and perihepatitis, barthollinitis; pummorathy in breast feeding infants; and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; secreted protein; proliferative disorder; cancer; tumour; foetal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder; AIDS; autoimmune disease; rheumation; allergy; neurological disorder; Alzheimer's disease; parkinson's disease; coqnitive disorder; schizophrenia; asthma; skin disorder; psoriasis; sepsis; diabetes; atherosclerosis; cardiovascular disorder; anglogenic disorder; kidney disorder; endocrine disorder; pregnancy-related disorder; endocrine disorder; pregnancy-related disorder; chemotaxis; food additive; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Axon AAD07705-AAD07759 represent cDNAs corresponding to 19 human secreted protein genes, and AAE03292-AAE03346 represent the proteins they encode. CC protein genes, and AAE03292-AAE03346 represent the proteins they encode. CC AAE03347 AAE03375 represent human secreted protein steed in the proteins of the protein or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the camount of the new protein in a sample or by determining the presence of amount of the new protein in a sample or by determining the presence of amount of the new genes. Specific uses are described for each of the capture disorders, cancer, tumours, foetal and developmental include developing products for the diagnosis or treatment of proliferative disorders, cancer, rumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, allorise autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allorises, neurological disorders, schizophrenia, asthma, allorises, neurological disorders, schizophrenia, asthma, skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, pregnancy related disorders, endocrine disorders, pregnancy related disorders, endocrine cardiovascular disorders, pregnancy related disorders, endocrine cardiovascular disorders, pregnancy related disorders, endocrine consuburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their connect ligands or binding partners, and in chemotrasis, and and connect connect ligands or binding partners, and in chemotrasis, and and disting or preservative to modify storage properties.

Antibodies specific for a protein of the invention can be used in diagnostic immunosasays e.g., radioimmunosasay or enzyme linked immunosable immunosasays e.g., radioimmunosasay or enzyme linked immunosable immunosable in in disagnostic inmunosasays e.g., radioimmunosasay or enzyme and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1.5%; Score 7; DB 22; Length 217;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium coryneform bacterium. Coryneform bacterium coryneform bacterium coryneform bacterium coryneform bacterium coryneform bacterium coryneform bacterium saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                        mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                            Novel polynucleotides derived from Coryneform bacteria, for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequences from the Coryneform bacterium Corynebacterium glutamicum. The are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 22, Application US/08363311
Patent No. 6548241
GENERAL INFORMATION:
APPLICANT: Michel, James L.
APPLICANT: Ausubel, Frederick M.
TITLE OF INVENTION: Conjugate Vaccine Against Group TITLE OF INVENTION: Streptococcus
NUMBER OF SEQUENCES: 29
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  COMPUTER: IBM PC compatible

Sequence 34, Application US/07869933
Patent No. 5770396
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: 1SOLATION, CHARACTERIZATION, AND USE OF
TITLE OF INVENTION: THE HUMAN B SUBUNIT OF THE HIGH AFFINITY RECEPTOR FOR
TITLE OF INVENTION: IMMUNOGLOBULIN
NUMBER OF SEQUENCES: 34
CORRESPONDENCE ADDRESS:
ADDRESSEE: Foley & Lardner
STREET: 1800 Diagonal Road, Suite 500
CITY: Alexandria
STREET: VA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 54;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: Plan PC compatible

Call transporting ATPase (EC 3.6.1.38) SERCA2a - chicken
N.Alternate names: calcium pump
(5.5pecies: Gallus gallus (chicken)
C.5pecies: Gallus gallus (chicken)
C.5pecies: Gallus gallus (chicken)
C.Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 22-Jun-1999
C.Accession: A40812
E.Campbell, A.M.; Kessler, P.D.; Sagara, Y.; Inesi, G.; Fambrough, D.M.
J. Biol. Chem. 266, 16050-16055, 1991
A.Title: Nucleotide sequences of avian cardiac and brain SR/ER Ca(2+)-ATPases and fun
A.Reference number: A40812; MUID:91340754
A.Molecule type: mRNA
A.Residues: 1-997 < CAM>
A.Accession: A40812
A.Molecule type: mRNA
C.Sereferences: GB:M66385; NID:9212652; PIDN:AA49066.1; PID:9212653
C.Superfamily: Na+/K+-transporting ATPase alpha chain; ATPase nucleotide-binding doma
C. Keywords: ATP; hydrolase
C. Superfamily: ATPase nucleotide-binding domain homology <ATN>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A Molecule type: mRNA
